

Stored Procedures

We will create and execute stored procedures on IBM Db2 using SQL. A stored procedure is a set of SQL statements that are stored and executed on the database server. So instead of sending multiple SQL statements from the client to the server, you encapsulate them in a stored procedure on the server and send one statement from the client to execute them. Also, stored procedures can be useful if you have an SQL query that you write over and over again. You can save it as a stored procedure, and then just call it to execute it. In stored procedures, you can also pass parameters so that a stored procedure can act based on the passed parameter values.

Software Used in this Lab

We will use an [IBM Db2 Database](#). Db2 is a Relational Database Management System (RDBMS) from IBM, designed to store, analyze and retrieve data efficiently. To complete this lab you will utilize a Db2 database service on IBM Cloud.

Data Used in this Lab

The data used in this lab is internal data. You will be working on the **PETSALE** table.

ID	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
1	Cat	450.09	2018-05-29	9
2	Dog	666.66	2018-06-01	3
3	Parrot	50.00	2018-06-04	2
4	Hamster	60.60	2018-06-11	6
5	Goldfish	48.48	2018-06-14	24

This lab requires you to have the PETSALE table populated with sample data on Db2. You might have created and populated a PETSALE table in a previous lab. But for this lab, it is recommended you download the [petsale_create_v2.sql](#) script provided in the course, upload it to Db2 console and run it. The script will create a new PETSALE table dropping any previous PETSALE table if exists, and will populate it with the required sample data.

Objectives

- Creating stored procedures
- Executing stored procedures

Instructions

When you approach the exercises in this lab, follow the instructions to run the queries on Db2:

- Go to the [Resource List](#) of IBM Cloud by logging in where you can find the Db2 service instance that you created in a previous lab under **Services** section. Click on the **Db2-xx service**. Next, open the Db2 Console by clicking on **Open Console** button. Click on the 3-bar menu icon in the top left corner and go to the **Run SQL** page. The Run SQL tool enables you to run SQL statements.

Exercise 1

In this exercise, you will create and execute a stored procedure to read data from a table on Db2 using SQL.

- Make sure you have created and populated the **PETSALE** table following the steps in the "**Data Used in this Lab**" section of this lab.

ID	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
1	Cat	450.09	2018-05-29	9
2	Dog	666.66	2018-06-01	3
3	Parrot	50.00	2018-06-04	2
4	Hamster	60.60	2018-06-11	6
5	Goldfish	48.48	2018-06-14	24

- You will create a stored procedure routine named **RETRIEVE_ALL**.
-

This **RETRIEVE_ALL** routine will contain an SQL query to retrieve all the records from the PETSALE table, so you don't need to write the same query over and over again. You just call the stored procedure routine to execute the query everytime.

To create the stored procedure routine, copy the code below and paste it to the textbox of the **Run SQL** page. Click **Run all**.

```
--#SET TERMINATOR @
CREATE PROCEDURE RETRIEVE_ALL      -- Name of this stored procedure routine
LANGUAGE SQL                     -- Language used in this routine
READS SQL DATA                  -- This routine will only read data from
the table
DYNAMIC RESULT SETS 1            -- Maximum possible number of result-sets
to be returned to the caller query
BEGIN
  DECLARE C1 CURSOR               -- CURSOR C1 will handle the result-set by
retrieving records row by row from the table
  WITH RETURN FOR                 -- This routine will return retrieved
records as a result-set to the caller query
  SELECT * FROM PETSAL;           -- Query to retrieve all the records from
the table
  OPEN C1;                       -- Keeping the CURSOR C1 open so that
result-set can be returned to the caller query
END
@                                -- Routine termination carácter
```

- To call the RETRIEVE_ALL routine, copy the code below in a **new blank script** and paste it to the textbox of the **Run SQL** page. Click **Run all**. You will have all the records retrieved from the PETSAL table.

```
CALL RETRIEVE_ALL;      -- Caller query
```

The screenshot shows a SQL IDE with two panes. The left pane displays the SQL code for calling the stored procedure RETRIEVE_ALL. The right pane shows the execution results, displaying a table with 5 rows of data from the PETSAL table.

ID	ANIMAL	SALEPRICE	SALDATE	QUANTITY
1	Cat	400.00	2018-04-29	4
2	Dog	666.66	2018-06-01	3
3	Parrot	50.00	2018-06-04	2
4	Hamster	60.00	2018-06-11	6
5	Goldfish	40.00	2018-06-14	24

4. You can view the created stored procedure routine RETRIEVE_ALL. Click on the 3-bar menu icon in the top left corner and click **EXPLORE > APPLICATION OBJECTS > Stored Procedures**. Find the procedure routine RETRIEVE_ALL from Procedures by clicking **Select All**. Click on the procedure routine **RETRIEVE_ALL**.

The screenshot displays the IBM Db2 Cloud interface for managing stored procedures. The top navigation bar includes 'IBM Db2 on Cloud', 'Storage: 22%', 'Cookie Preferences', 'Discover', and user icons. The main section is titled 'STORED PROCEDURES' and features a search bar 'Filter by schema name or procedure name'. On the left, a 'Schemas' list shows various schemas, with 'Select All' highlighted. The central 'Procedures' table lists several procedures, with 'RETRIEVE_ALL' in the 'ZJH17769' schema selected. The right panel, 'Procedure Parameters', shows the SQL code for the 'RETRIEVE_ALL' procedure, which is a stored procedure that retrieves data from the 'PETS' table.

5. If you wish to drop the stored procedure routine RETRIEVE_ALL, copy the code below and paste it to the textbox of the **Run SQL** page. Click **Run all**.

```
DROP PROCEDURE RETRIEVE_ALL;  
CALL RETRIEVE_ALL;
```

The screenshot shows the 'Run SQL' page in IBM Db2 Cloud. The left pane contains the SQL code: `DROP PROCEDURE RETRIEVE_ALL;` and `CALL RETRIEVE_ALL;`. The right pane displays the execution results. The first statement, `DROP PROCEDURE RETRIEVE_ALL;`, was successful with a run time of 0.023 seconds. The second statement, `CALL RETRIEVE_ALL;`, failed with a run time of 0.000 seconds. The error message states: "No authorization routine named 'RETRIEVE_ALL' of type 'PROCEDURE' having compatible arguments was found. SQLCODE=-440, SQLSTATE=42884, DRIVER=4.36.14".

Exercise 2

In this exercise, you will create and execute a stored procedure to write/modify data in a table on Db2 using SQL.

1. Make sure you have created and populated the **PETSALE** table following the steps in the "**Data Used in this Lab**" section of this lab.

ID	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
1	Cat	450.09	2018-05-29	9
2	Dog	666.66	2018-06-01	3
3	Parrot	50.00	2018-06-04	2
4	Hamster	60.60	2018-06-11	6
5	Goldfish	48.48	2018-06-14	24

2. You will create a stored procedure routine named **UPDATE_SALEPRICE** with parameters **Animal_ID** and **Animal_Health**.

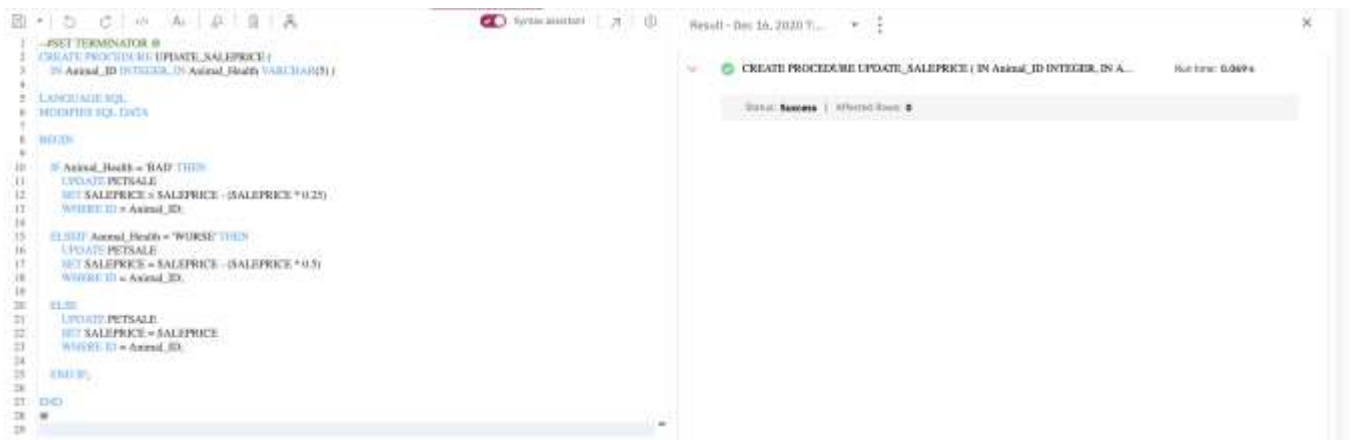

This **UPDATE_SALEPRICE** routine will contain SQL queries to update the sale price of the animals in the PETSALE table depending on their health conditions, **BAD** or **WORSE**.

This procedure routine will take animal ID and health condition as parameters which will be used to update the sale price of animal in the PETSALE table by an amount depending on their health condition. Suppose:

- For animal with ID XX having BAD health condition, the sale price will be reduced further by 25%.
- For animal with ID YY having WORSE health condition, the sale price will be reduced further by 50%.
- For animal with ID ZZ having other health condition, the sale price won't change.

To create the stored procedure routine, copy the code below and paste it to the textbox of the **Run SQL** page. Click **Run all**.

```
--#SET TERMINATOR @
CREATE PROCEDURE UPDATE_SALEPRICE (
    IN Animal_ID INTEGER, IN Animal_Health VARCHAR(5) )    -- ( { IN/OUT type
} { parameter-name } { data-type }, ... )
LANGUAGE SQL                                              -- Language used
in this routine
MODIFIES SQL DATA                                       -- This routine
will only write/modify data in the table
BEGIN
    IF Animal_Health = 'BAD' THEN                        -- Start of
conditional statement
        UPDATE PETSale
        SET SALEPRICE = SALEPRICE - (SALEPRICE * 0.25)
        WHERE ID = Animal_ID;
    ELSEIF Animal_Health = 'WORSE' THEN
        UPDATE PETSale
        SET SALEPRICE = SALEPRICE - (SALEPRICE * 0.5)
        WHERE ID = Animal_ID;
    ELSE
        UPDATE PETSale
        SET SALEPRICE = SALEPRICE
        WHERE ID = Animal_ID;
    END IF;                                              -- End of
conditional statement
END
@                                                         -- Routine
termination character
```

- Let's call the `UPDATE_SALEPRICE` routine. We want to update the sale price of animal with ID **1** having **BAD** health condition in the `PETSale` table. Copy the code below in a **new blank script** and paste it to the textbox of the **Run SQL** page. Click **Run all**. You will have all the records retrieved from the `PETSale` table.

```
CALL RETRIEVE_ALL;
CALL UPDATE_SALEPRICE(1, 'BAD');      -- Caller query
CALL RETRIEVE_ALL;
```

The screenshot shows a SQL IDE with three queries executed. The first query, `CALL RETRIEVE_ALL;`, returns a table with 5 rows. The second query, `CALL UPDATE_SALEPRICE(1, 'BAD');`, is successful. The third query, `CALL RETRIEVE_ALL;`, returns the same table, but the sale price for animal ID 1 is now 337.56.

ID	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
1	Cat	337.56	2018-05-29	4
2	Dog	666.66	2018-06-01	3
3	Parrot	50.00	2018-06-04	2
4	Hamster	65.60	2018-06-11	6
5	Goldfish	48.40	2018-06-14	24

- Let's call the `UPDATE_SALEPRICE` routine once again. We want to update the sale price of animal with ID **3** having **WORSE** health condition in the `PETSale` table. Copy the code below and paste it to the textbox of the **Run SQL** page. Click **Run all**. You will have all the records retrieved from the `PETSale` table.

```
CALL RETRIEVE_ALL;
CALL UPDATE_SALEPRICE(3, 'WORSE');    -- Caller query
CALL RETRIEVE_ALL;
```

The screenshot shows a SQL IDE with three queries executed. The first query, `CALL RETRIEVE_ALL;`, returns a table with 5 rows. The second query, `CALL UPDATE_SALEPRICE(3, 'WORSE');`, is successful. The third query, `CALL RETRIEVE_ALL;`, returns the same table, but the sale price for animal ID 3 is now 73.00.

ID	ANIMAL	SALEPRICE	SALEDATE	QUANTITY
1	Cat	337.56	2018-05-29	4
2	Dog	666.66	2018-06-01	3
3	Parrot	73.00	2018-06-04	2
4	Hamster	65.60	2018-06-11	6
5	Goldfish	48.40	2018-06-14	24

- You can view the created stored procedure routine UPDATE_SALEPRICE. Click on the 3-bar menu icon in the top left corner and click **EXPLORE > APPLICATION OBJECTS > Stored Procedures**. Find the procedure routine UPDATE_SALEPRICE from Procedures by clicking **Select All**. Click on the procedure routine **UPDATE_SALEPRICE**.

STORED PROCEDURES

Filter by schema name or procedure name

Schemas

- Select All
- AUDIT 2 procedures
- ZJH17769 2 procedures
- DB2INST1 1 procedure
- ERRORSCHEMA 0 procedure
- SQL74605 0 procedure
- ST_INFORMTN_SCHEMA 0 procedure

Procedures

NAME	SCHEMA	PROPERTIES
CONNECT_CHE...	DB2INST1	---
LOAD	AUDIT	---
RETRIEVE_ALL	ZJH17769	---
UPDATE	AUDIT	---
UPDATE_SALEP...	ZJH17769	---

Procedure Parameters

UPDATE_SALEPRICE

```
CREATE PROCEDURE UPDATE_SALEPRICE (
  IN Animal_ID INTEGER, IN Animal_Name VARCHAR(5) )
  Input/output type parameter: {} parameter-name {} data-type {}
  LANGUAGE SQL
```

PARAMETER	DATA TYPE	MODE	LENGTH	SCALE	LOCAT
ANIMAL_ID	INTEGER	IN	4	0	No
ANIMAL_HEA...	VARCHAR	IN	5	0	No

- If you wish to drop the stored procedure routine UPDATE_SALEPRICE, copy the code below and paste it to the textbox of the **Run SQL** page. Click **Run all**.

```
DROP PROCEDURE UPDATE_SALEPRICE;
```

Run SQL

```
1 DROP PROCEDURE UPDATE_SALEPRICE;
```

Results - Dec 16, 2020 8:...

Statement	Status	Message	Run time
DROP PROCEDURE UPDATE_SALEPRICE;	Success		0.024 s
CALL UPDATE_SALEPRICE(5, 'Bady');	Failed	Error message: No authorized routine named 'UPDATE_SALEPRICE' of type 'PROCEDURE' having compatible arguments was found. SQLSTATE=4201, SQLSTATE=42084, DBP00000.26.14	0.008 s
